          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Submitted (MAR-1996) to the EMBL/GenBank/DDBJ databases.

-- FUNCTION: Membrane bound hemoprotein which function as an electorarier for several membrane bound oxygenases (By similarity).

-- SUBCELLULAR LOCATION: MICROSOMAL MEMBRANE. BOUND TO THE CYTOPLASMIC SIDE OF THE ENDOPLASMIC RETICULUM (BY SIMILARITY).

-- SIMILARITY: BELONGS TO THE CYTOCHROME B5 PAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  STRAIN=cv.                                                                                                                                                                                                         PIANT MOLECULAR SECURITY: 537 (1994).

-!- FUNCTION: CYTOCHROME BS IS A MEMBRANE BOUND HEMOPROTEIN WHICH FUNCTION AS AN ELECTRON CARRIER FOR SEVERAL MEMBRANE BOUND OXYGENNASES. MAY PLAY A KEY ROLE IN THE MODIFICATION BY DESATURATION OF FATTY ACIDS IN THE ENDOPLASMIC RETICULUM, WHICH IN THE DEVELOPING SEED IS UTILIZED FOR MEMBRANE SYNTHESIS AND IN THE DEVELOPMENTALLY REGULATED PRODUCTION OF LARGE AMOUNTS OF STORAGE LIPIDS. IS INVOLVED IN THE REDUCTION OF CYTOCHROME P-450 AND MAY THEREFORE BE INVOLVED IN FLAVONOID BIOSYNTHESIS IN THE PETALS.
-!- SUBCELLULAR LOCATION: MICROSOMAL MEMBRANE. BOUND TO THE CYTOPLASMIC SIDE OF THE ENDOPLASMIC RETICULUM (BY SIMILARITY).
-!- TISSUE SPECIFICITY: IS HIGHLY EXPRESSED IN DEVELOPING SEEDS, MODERATELY EXPRESSED IN FLOWERS, AND IS EXPRESSED AT LOW
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CONFLICT

SIMILARITY: Contains 1 cytochrome b5 heme-binding domain.
SIMILARITY: TO FAD/NAD-BINDING CYTOCHROME REDUCTASES IN T
                                                                                                                                                                     FUNCTION: Nitrate reductase is a key enzyme involved in the first
step of nitrate assimilation in plants, fungi and bacteria.
CATALYTIC ACTIVITY: Nitrite + NADP(+) + H(2)O = nitrate + NADPH.
                                                                C-TERMINAL DOMAIN.

"Developmental stage-specific and nitrate-independent regulation of nitrate reductase gene expression in rapeseed.";

Plant Physiol. 111:39-47(1996).

-i- FUNCTION: Nitrate reductase is a key enzyme involved in the first step of nitrate assimilation in plants, fungi and bacteria.

-i- CATALYTIC ACTIVITY: Nitrite + NAD(+) + H(2)O = nitrate + NADH.

-i- COPACTOR: REQUIRES FAD, A HEME GROUP (CALLED CYTOCHROME B-557)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. CATALYTIC ACTIVITY: Nitrite + NAD(+) + H(2)0 = nitrate + NADH.

COFACTOR: EACH SUBUNIT OF THE ENZYME CONTAINS 1 EQUIVALENT OF FAD, HEME IRON, AND MOLYBDENUM-PTERIN AS PROSTHETIC GROUPS. THE HEME GROUP IS CALLED CYTOCHROME B-557.

ENZYME REGULATION: REGULATED BY THE NITROGEN SOURCE AND CONTROLLED BY THE CIRCADIAN RHYTHM.
SIMILARITY: Contains 1 cytochrome b5 heme-binding domain SIMILARITY: TO FAD/NAD-BINDING CYTOCHROME REDUCTASES IN 7 C-TERMINAL DOMAIN.
                                                                                         SUBUNIT: Homodimer.

   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
